Executive Summary

Each year, the Regional Transportation Commission of Southern Nevada (RTC), the Southern Nevada Water Authority (SNWA), the Southern Nevada Regional Planning Coalition (SNRPC), the Center for Business and Economic Research (CBER) at the University of Nevada, Las Vegas, and a group of community demographers and analysts work together to provide a long-term forecast of economic and demographic variables influencing Clark County's population growth. The primary goal is to develop a long-term forecast of the Clark County population that is consistent with the structural economic characteristics of the county. Toward this end, we employ a general-equilibrium demographic and economic model developed by Regional Economic Models, Inc. (REMI), specifically for Clark County.

The model recalibration incorporates the most recent available information regarding local employment growth, local transit investment, and an amenity factor representing negative externalities from local growth. The resulting long-term forecast predicts positive population growth throughout the range of the forecast. By 2035, we predict that Clark County's population will reach approximately 2.72 million. By 2050, we predict that it will reach nearly 3.18 million.

Table 1 summarizes the population forecast. We anticipate stronger population growth. The population in Clark County is predicted to grow at a rate of 2.0 percent in 2014. Despite short-term economic uncertainties and modeling difficulties, we note that this forecast is intended for medium- to long-term planning purposes. In the medium term, the population growth rate declines to 1.5 percent by 2018 as the Southern Nevada economy moves closer to maturity. In the long term, population growth begins to taper off as the maturing economy attracts fewer economic migrants. By 2020, annual

population growth has declined to 1.1 percent. By 2050, the growth reaches 1.0 percent, roughly twice the projected¹ long-term national population growth rate. This represents a long-term convergence to the national average annual population growth rate.

As is typical of any forecast, there are potential risks which could lead to either over- or underestimated population growth in the short run. The principal risk to our forecast is the recovery of the Southern Nevada economy in the short term. The assumption underlying this forecast is that the local economy will continue to recover in 2014 and 2015. To the extent that the near-term economic outlook differs, the short-run forecasts will differ. We believe, however, that these risks tend to arise from short-term uncertainty; whereas, our forecasts are primarily meant to be long-term planning tools.

I. Introduction

Each year, the Regional Transportation Commission (RTC), the Southern Nevada Water Authority (SNWA), the Southern Nevada Regional Planning Coalition (SNRPC), the Center for Business and Economic Research (CBER) at the University of Nevada, Las Vegas, and a group of community demographers and analysts work together to provide a long-term forecast of economic and demographic variables influencing Clark County. The primary goal is to develop a long-term forecast of the Clark County population that is consistent with the structural economic characteristics of the county. Toward this end, we employ a general-equilibrium demographic and economic model developed by Regional Economic Models, Inc. (REMI), specifically for Clark County.

The REMI model is a state-of-the-art econometric forecasting model that accounts for dynamic feedbacks between economic and demographic variables. Special features allow the user to update the model to include the most current economic information. CBER calibrates the model using information on recent local employment levels, the most recent national Gross Domestic Product (GDP) forecast, spending on local capital projects, and adjustments for amenities related to local population growth.

The model employed divides Nevada into five regions: Clark County; Nye County; Lincoln County; Washoe County; and the remaining counties, which are combined to form a fifth region. These regions are modeled using the U.S. economy as a backdrop. The model contains over 100 economic and demographic relationships that are carefully constructed to concisely represent the Clark County economy. The model includes equations to account for migration and trade between Nevada counties and other states and counties in the country.

The demographic and economic data used to construct the model begin in 1990, the most important of which include the aggregate totals of employment, labor force, and population. The economic data for the most recent version of the model (REMI PI+ v1.5) are consistent with the North American Industry Classification System (NAICS). The REMI PI+ v1.5 model was released in 2013. Hence the model's most recent data are from 2011 because the Bureau of Labor Statistics (BLS) personal-income data are reported with a two-year lag. Over the years, the availability of the income data has been the key in setting the last year of history in the model.

The REMI model is the best model available for describing how economies interact geographically.² These interactions may take place within a single economy (such as the interaction between house-price growth and employment growth in Clark County) or between two economies (such as the interaction between Southern Nevada and Southern California). These and over 100 other interactions contained within the model are too complex to consider modeling on our own. Rather, we turn to the REMI model because it has a solid foundation in economic theory and the principles of general-equilibrium-based growth distribution, yet it still offers the flexibility required to model a regional economy like Clark County.

To guarantee that the most current data are used in the forecast, we make a series of adjustments to the model. In this way, we ensure that the forecast model includes the best available information at the time the forecast is made. First, the model's national GDP forecast is updated using the latest available national forecast from the University of Michigan's Research Seminar in Quantitative Economics (RSQE). The second adjustment updates the model with the employment figures from the Nevada Department

² See Schwer, R. K. and D. Rickman (1995), "A comparison of the multipliers of IMPLAN, REMI and RIMS II: Benchmarking ready-made models for comparison," *The Annals of Regional Science*.

of Employment, Training, and Rehabilitation (DETR). Next, we include planned new investment in public infrastructure using information from RTC. The fourth adjustment accounts for the potential secondary effects of population growth on the quality of life in Clark County. Lastly, we rebase the population forecast to the most recent population estimate for Clark County available from SNRPC.

In the following section, we first examine the changes in the REMI model from the prior year's model. Following that, in Section III, we present sequentially the changes we make to update the model and tailor it to local information. In Section IV, we present the population forecast and give a brief discussion of the economic environment surrounding the forecast. In Section V, we compare the population growth forecast with previous years' forecasts. We conclude with a discussion of the risks to the forecast.

II. Comparison of REMI Models: Current and Previous Year

Over the years, we have compared the most recent out-of-the-box REMI models, that is, the current forecast before any model recalibrations are made, with corresponding out-of-the-box forecasts from the previous models. This gives us the opportunity to examine how the new model differs from the previous versions and to explore the basis of these differences.

The most recent data used to develop this year's model are from 2011. Thus, we refer to the current model as last historical year 2011 (LHY2011) and the previous model as last historical year 2009 (LHY2009).

Each year the REMI staff and users discuss the workings of the model and propose changes for improvement. Based on research findings, each year's model incorporates improvements in addition to the inclusion of more recent data. The new model, identified as PI+ v1.5, offers one major improvement; it includes a new commuter

flow equation. In prior models, the commuter flows are set to the last historical year values. These values are determined by Journey to Work and Residence Adjustment data from the Census Bureau and the Bureau of Economic Analysis (BEA). The new equation takes into account the spatial distance and relative cost of living between places of residence and places of work. These model updates and the new data history for 2011 lead to the differences in the out-of-the-box population forecast between the LHY2011 model and the LHY2009 model.

Figures 1 and 2 compare the LHY2011 and LHY2009 population forecasts from the out-of-the-box models, i.e., without any updating for employment, infrastructure projects, the amenity factor, or the national GDP forecast.³ The out-of-the-box population forecast arising from the LHY2011 model predicts lower population levels for 2014 through 2035 than the LHY2009 model. With regards to population levels, the difference between the two forecasts is relatively small in 2014 but gets larger in the later years of the forecast. By 2035, the out-of-the-box forecasted population in the LHY2011 model is nearly 210,000 people lower than the LHY2009 model.

³ The detailed out-of-the-box results through 2050 appear in Table A1 of the Appendix.

Figure 1: Clark County Population Forecasts: REMI Out-of-the-Box LHY2011 and LHY2009: 2014-2035

Note: Out-of-the-box refers to the model prior to recalibration. These numbers are not the final forecast.

Figure 2: Clark County Population-Growth-Rate Forecasts: REMI Out-of-the-Box LHY2011 and LHY2009: 2014-2035

Note: Out-of-the-box refers to the model prior to recalibration. These numbers are not the final forecast.

The lower out-of-the-box forecasted population levels from the LHY2011 model are due to the additional economic history, from 2010 and 2011, and the short-term economic forecast for 2012. The Las Vegas metropolitan area lost 11,500 jobs in 2010 and gained 9,500 jobs in 2011, for a net loss of 2,000 jobs over the two-year period. In addition, the LHY2011 model has a more conservative employment growth rate forecast for 2012, 2.3 percent, compared to the LHY2009 model's employment growth rate forecast of 3.5 percent for 2012. As a result, the LHY2011 model has fewer economic migrants and a lower population in 2012. This translates to the lower out-of-the-box population forecasts for the LHY2011 model compared to the LHY2009 model.

III. Recalibrating the Model

County-level personal income is only available with a two-year lag. As a result, the REMI model also has a two-year lag with the most recent historical data from 2011 for the current model, PI+ v1.5, released in 2013. To bring the model up to date, we update available pertinent model information, including the most recent national GDP forecast, more recent employment figures, spending on capital projects, and adjustments for disamenities related to population growth to reflect local information in the forecast. We describe each update in turn.

In previous years, we made an adjustment to future hotel employment based on local expectations of hotel rooms that will be added in the near future. This ensures that the model includes a good short-term forecast of new hotel investment and employment. This year, the Las Vegas Convention and Visitors Authority (LVCVA) projects that 5,776 new hotel/motel rooms will be added to the local room stock by the end of 2016. Assuming a jobs-to-room multiplier of 1.6, this would imply roughly 9,242 new jobs for the accommodation sector. However, the REMI model's baseline employment forecast

for the accommodation industry already predicts 18,830 additional jobs by the end of 2016. As a result, we did not make an additional adjustment for new hotel rooms. The current forecast relies on the REMI model's growth forecast for the accommodation sector in the near term. The REMI model's baseline employment growth forecast for the accommodation industry is roughly 3.5 percent in the years 2014 and 2015.

A. Adjustment of the national GDP forecast

The REMI model relies on a baseline national GDP forecast from the University of Michigan's Research Seminar in Quantitative Economics (RSQE). The current REMI model, PI+ v1.5, utilizes the March 2013 GDP forecast from RSQE. We adjust the model's national GDP forecast using the March 2014 national GDP forecast from RSQE. Overall, we adjusted the national GDP components downward by about \$498 billion in 2014 and \$591 billion in 2015. The adjusted national forecast is used to generate a new baseline forecast for Clark County. The baseline forecast is then used for the subsequent adjustments.

B. Employment adjustment

One of the most noteworthy updates we make to the REMI model is the employment adjustment. The industry-level employment data used by REMI are the sum of the BLS wage and salary estimates for Clark County and REMI's BLS-based estimate of the number of proprietors. The most recent historical year in the model's employment data is 2011. However, more recent wage and salary employment data are available from the Nevada DETR for 2012 and 2013. Thus, we update the model to account for the more recent information.

The latest growth rates for the out-of-the-box REMI-model forecasts and recent DETR estimates are shown in Table 2 for 2012 and 2013. The actual growth rates from

DETR differ noticeably from the REMI out-of-the-box forecasts, suggesting a clear need for adjustments. The employment update is as follows: We calculate the annual percentage change using DETR data and apply the percentage changes to generate new estimates for 2012 and 2013. The underlying assumption of this procedure is that the proportion of self-employed in each industry classification grows at the same rate as does the ratio between full- and part-time workers.

Industrial Classification	REMI Baseline Forecast		DETR Estimates	
	2012	2013	2012	2013
Construction	5.96%	6.90%	-0.53%	9.09%
Wholesale trade	-3.85%	-1.33%	-0.50%	1.49%
Retail trade	1.08%	0.27%	3.50%	2.56%
Transit, ground pass transportation	-4.55%	-4.76%	3.10%	0.75%
Monetary authorities, et al.	-2.01%	0.68%	2.24%	2.19%
Ins carriers, related activities	-3.84%	1.37%	3.07%	4.26%
Real estate	0.87%	1.20%	5.81%	4.40%
Professional, technical services	2.53%	2.57%	1.83%	4.50%
Management of companies	1.98%	1.41%	9.15%	1.94%
Administrative, support services	3.33%	2.45%	4.70%	5.39%
Ambulatory health care services	3.05%	3.78%	2.90%	3.13%
Hospitals	3.54%	3.79%	2.53%	1.23%
Amusement, gambling, and recreation	1.64%	2.00%	3.31%	1.60%
Accommodation	3.39%	3.24%	-0.60%	0.18%
Food services, drinking places	3.39%	2.97%	3.25%	6.16%
Total	2.31%	2.33%	2.09%	2.88%

Table 3 reports the updated employment data by category for the model. The Clark County job growth numbers in 2012 and 2013 suggest that general economic conditions are still improving in the Las Vegas area. While the Southern Nevada economy gained 1.3 percent of its total employment in 2011, the DETR estimates suggest that Clark County employment grew by about 2.1 percent and 2.9 percent in 2012 and 2013, respectively. Strong positive job growth took place in 2012 in key sectors such as health

care services, retail, and food services. However, other key sectors such as construction and accommodation experienced job losses in 2012. Overall, Southern Nevada's economy gained roughly 22,000 jobs in 2012.

Industrial Classification	Baseline	DETR Growth Rates		Adjusted Job Levels	
	History 2011	2012	2013	2012	2013

The local economic recovery continued in 2013 with stronger employment growth. Most sectors of Southern Nevada's economy experienced positive job growth in 2013. The construction sector experienced strong positive job growth in 2013 for the first time since

the beginning of the economic recession. Strong employment gains also occurred in key sectors such as health care, retail, and food services. Overall, Southern Nevada's economy gained roughly 29,500 jobs in 2013.

C. Transportation and infrastructure improvements

Clark County has continued to invest in transportation infrastructure such as roads, highways, and mass transit. The model assumes that public-infrastructure investment will continue at a pace consistent with the model history. Thus, some local spending on public infrastructure, such as road building and additional services, is built into the model. However, one-time monies tend to come from outside the region (for example, federal transportation funding). These large, special projects need to be accounted for in the forecast.

The estimated federal funding in transportation-infrastructure investment is about \$682 million in 2014, \$4.54 billion between 2015 and 2025, and \$4.21 billion between 2026 and 2035.⁴ These expenditures are annualized and included in the REMI model as new construction projects.

D. Amenity adjustments

For over a decade, the Las Vegas metropolitan area was one of the fastest-growing communities in the United States. This has helped maintain a vibrant economy, but research has shown that rapid urban expansion is frequently correlated with a diminishing quality of life as congestion, deteriorating air quality, and a shortage of public services take their toll on local populations. These “negative externalities” arising from rapid growth impose costs on local residents, making the county less attractive to those living

⁴ Source: Regional Transportation Commission.
Center for Business and Economic Research
University of Nevada, Las Vegas

here and potential in-migrants. As a result, people are more likely to relocate to areas with a higher quality of life, all else being equal.

To account for the rising social costs of negative externalities from growth, we include an amenity factor in the model. We assume that the social costs of growth rise by 0.033 percent each year. The amenity factor is introduced in the model through the wage equations, effectively causing real wages to fall relative to other regions. Falling wages means less economic migration, and population growth slows as the desirability of Clark County falls.

E. Rebasing the population forecast

We rebase the population forecasts using the population update feature in the REMI model. We update the population in 2013 based on the most recent information available for use from the SNRPC. The SNRPC consensus population estimate for Clark County in 2013 is 2.06 million. In addition, we update the population levels in 2014 and 2015 to reflect the population growth rate forecast from CBER's *2014 Economic Outlook*, which was published in December 2013. The latter adjustment is intended to incorporate the views of local economic experts at CBER in the short-term population forecasts. CBER predicts that the Clark County population will grow by 2.0 percent in 2014 and 2.1 percent in 2015. These population growth-rate forecasts translate to a forecasted population of 2.10 million in 2014 and 2.15 million in 2015. We also predict that the Clark County population growth rate will decline by roughly 0.2 percent per year from 2016 to 2018. These population growth-rate forecasts translate to a forecasted population of 2.19 million in 2016, 2.23 million in 2017, and 2.26 million in 2018. We use these forecasted population levels to update the population in the REMI model.

IV. Analysis of the Economic and Demographic Forecast

The forecast predicts moderate rates of population growth for Southern Nevada over the forecast period extending out to 2050. The rate of growth, which has been decidedly greater than the national average over the past fifty years, is beginning to moderate and move toward the national rate of growth. The economic forecast calls for the continuation of the economic recovery in 2014 and steady employment growth through 2018. Tables 4 through 6, respectively, report the population, employment, and Gross Regional Product (GRP) predictions for Clark County from the calibrated model.

A. Population

In the short term, the current forecast predicts moderate rates of population growth in Southern Nevada. The population in Clark County is predicted to grow at a rate of 2.0 percent in 2014 and 2.1 percent in 2015. The population growth rate declines in the medium term as the Clark County economy moves closer to maturity. By 2020, the population growth rate falls to 1.1 percent as the Clark County economy is expected to mature; and it reaches 1.0 percent, roughly twice the projected⁵ long-term national population growth rate, by 2050. This pattern of long-term growth is expected as our economy matures and is very similar to previous forecasts.

Clark County is forecasted to add roughly 41,000 new residents in 2014. CBER's 2014 Southern Nevada Economic Outlook predicts that population growth will strengthen with employment in the near term, and it will not be a driver of economic growth as it was throughout much of Las Vegas' history. Rather, economic growth will drive population in the next few years. The population forecast predicts that the Clark County population will be roughly 3.18 million by 2050.

⁶ A table detailing the rebased population forecast appears in the Appendix – Table A2.

B. Employment

The forecast predicts a steady economic recovery for Southern Nevada in 2014. The Las Vegas economy is forecasted to add an additional 33,000 jobs in 2014, which represents a 2.9 percent growth in employment over 2013. Employment growth is predicted to remain strong in 2015 as the economy is predicted to add 36,000 new jobs. The forecast also predicts a continuation of steady employment growth in the near term. It is predicted that the Las Vegas economy will exceed the 2007 peak employment level (1.18 million jobs) by 2015. Employment growth reaches a peak of 3.1 percent in 2015 and then eventually stabilizes at around 1.0 percent as the Southern Nevada economy reaches maturity. See Table 5.⁷

⁷ Unadjusted employment forecasts are shown in the Appendix.

Table 5: Employment History and Forecasts				
Year	Employment Forecast	Change in Employment Forecast	Growth in Employment Forecast	Employment-Population Ratio Forecast

C. Gross regional product

Gross Regional Product (GRP) is defined as the dollar value of all final goods and services for sale in a regional economy. As such, it reflects the output of a local economy and avoids double-counting initial and intermediate goods. The forecast for growth in the

Clark County GRP, shown in Table 6, basically mirrors the growth pattern of local employment. The GRP growth forecast starts at 4.2 percent in 2014, and climbs up to 4.6 percent in 2015. The GRP growth forecast finally stabilizes at around 2.3 percent as the Southern Nevada economy reaches maturity.

Table 6: Gross Regional Product History and Forecasts				
Year	GRP (Billions of Chained 2012\$) REMI Forecast	Change in GRP (Billions of Chained 2012\$) REMI Forecast	Growth in GRP (Billions of Chained 2012\$) REMI Forecast	GRP per Capita (Chained 2012\$) REMI Forecast

V. Comparing Current Forecast with Previous Years of the Forecast

This section compares this year's final population growth forecasts with the final population growth forecasts from previous years. This exercise allows us to assess the consistency of the forecast methodology and to assess the variability in the population growth forecasts over the last eight years. Figure 3 shows the population-growth-rate forecasts obtained from 2007 to 2014. Figure 3 also shows the standard deviation of the population-growth-rate forecast in the last 14 years (2001-2014).⁸ The population-growth-rate forecasts exhibit a high level of variability in the near term. The standard deviation of the population-growth-rate forecast for the year 2014 is roughly 1 percent. This reflects a high degree of uncertainty in the short-term forecast (see Section VI). The variability among the population-growth-rate forecasts falls dramatically in the long term. By 2030, the forecasted growth rates converge to about 1.3 percent, with a standard deviation of 0.2 percent. Hence, there is a large degree of consistency in the long-term growth predictions obtained during the last 14 years, as evidenced by the low standard deviation among the forecasts. This observation further confirms the fact that our forecasts are primarily meant to be long-run planning tools.

⁸ The standard deviation is a measure of the variability among data points. For data that follow a normal distribution, 99.7 percent of data points will fall within approximately 3 standard deviations of the mean.

Figure 3: Clark County Historic Population-Growth-Rate Forecasts: 2014-2035

VI. Risks to the Forecast

Our Southern Nevada population forecasts rest on economic and demographic models set in the context of a structured framework. This structure keeps our long-term forecasts consistent with our objectives. We have separated the long-term trend from the noise that one finds in time-series data. These noise factors include the business cycle and seasonal and irregular events.

The main risks to the population forecasts arise from short-term fluctuations in both U.S. and Southern Nevada economic conditions. The recovery of the Southern Nevada economy is based on the idea that improving economic conditions in the United States, particularly in the West, will benefit the Southern Nevada economy. The Southern Nevada economy could see slower growth if the U.S. economy proves weaker than we

have forecast. If and when growth of the U.S. economy suddenly accelerates, the Southern Nevada economy will be much stronger. A stronger Southern Nevada economy could mean a return of the Hispanic migrant population which left as a result of the economic recession. This would result in higher population growth rates than those we are seeing in the current forecast.

Therefore, although we feel the population forecasts are sound, there are significant risks to the forecasts that could lead to either over- or underestimated growth. We say again, however, that these risks tend to arise from short-term uncertainty; whereas, our forecasts are primarily meant to be long-term planning tools.

VII. Conclusion

The latest REMI model projects long-term population growth patterns that are consistent with previous population forecasts. Overall, the population forecast is higher than last year's forecast. This is a reflection of the new data incorporated into the model that take into account the recent economic recession. We note that, despite short-term economic uncertainties and model difficulties, the long-term population forecast, which is the main focus of this forecasting exercise, remains consistent with past forecasts. By 2035, we predict that Clark County's population will be about 2.72 million. In 2050, Clark County is expected to have nearly 3.18 million residents.
